In expts on microorganisms which are active against the causative factor of scleroma, Grigor'yev-Shiga bacilli, Flexner bacilli, staphylococci, diphtheria bacilli, and streptococci, it has been shown that strains adapted to low temperatures must pass through a cold stage in order to develop the maximum production of antibiotics both in the course of ontofenesis and phylogensis. There is complete analogy between the relationships established by Lysenko and vernalization and phase development of higher plants in general.

Title : Certain Lines of Evolution of the Ability to Produce Antibiotic

Orig Pub. : Sb. nauchn. rabot. Dnepropetr. med. in-t, 1956, 1, 37-38

Abstract : The action of low temperatures directly after the inoculation of microorganisms stimulates the formation of antibiotic and accelerates the growth of mycelia. The effect of low temperatures does not affect the ability of developed cultures to produce antibiotic. After the prolonged action of low temperature the majority of spores ready for germination lost their capacity of germination, but a certain number of the spores were capable of undergoing certain phases in the developmental process at the low temperature, after which they developed more rapidly and produced a larger quantity of antibiotic.--S.P. Shapovalova.

antibiotic substances is considerably strengthened if they are subjected to the action of cold in the post-inoculation stage of development. The author considers that the need for cold during the post-inoculation period of development is one facet of the microbe-antagonists' adaptability to conditions of existence in soil; therefore, many microbes require other temperature conditions during the growth stages than at subsequent stages of development. -- Ya. I. Rautenshteyn

TITLE: A method for obtaining vinyl polymers with conjugate bonds. Class 39, No. 183396 [announced by State Scientific Research Institute for Plastics Polymerization and Experimental Plant (Gosudarstvennyy nauchno-issledovatel'skiy institut polimerizatsionnykh plastmass i Eksperimental'nyy zavod)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 78

TOPIC TAGS: vinyl, polymer, conjugate bond system, polyvinyl alcohol, ammonia

ABSTRACT: This Author Certificate presents a method for obtaining vinyl polymers with conjugate bonds by dehydrating regular polyvinyl alcohol. To improve the regulation of the process and to prevent carbonation of the polymer, dehydration is conducted in ammonia at the temperature 140--150C.

TITLE: Pipe Welding by Radio-Frequency Current

PERIODICAL: Svarochnoye proizvodstvo, 1960, No. 10, pp. 4-7

TEXT: The welding of up to 6 mm thick pipes by radio-frequency current was first investigated in 1958 at TsNIITMASh. Further studies were performed together with NIITVCh. The following personalities participated in the work: from TsNIITMASh: I. L. Brinberg, Candidate of Technical Sciences; from VNIIMETMASh: V. V. Nosal', Doctor of Technical Sciences, Anisiforov, Candidate of Technical Sciences, N. A. Sarychev, and V. S. Antsiferov, engineers; from NIITVCh: N. P. Glukhanov, Candidate of Technical Sciences. On a laboratory installation (Fig. 2) strips with chamfered edges were drawn by clamping rollers at a required opening angle between the edges to be welded (α). The overlap of the strips was fixed by supporting rollers. Radio frequency current was fed to the edges through sliding contacts. The current was concentrated on the edge

Card 1/3

Pipe Welding by Radio-Frequency Current

surface and penetrated to a depth of 0.04 - 0.12 mm. The molten metal was pressed by the rollers thus forming the welded joint. The welding speed was 3.5 - 20 m/min. The magnitude of compression ranged from 0 to 4,000 kg. Experimental welds were made on 3 - 6 mm thick carbon steel strips with chamfered edges. Specimens of the welds were subjected to static tests and showed a strength equalling that of the base metal. The quality of the joint is determined by the uniform heating of the edges. Stable heating conditions are obtained at an opening angle of the edges not below 4°. The uniformity of heating is enhanced by a greater slope of the chamfer (β). Best results were obtained at $\beta = 42^{\circ}$. The quality of the welds depends moreover to a high degree on the dimension of the overlap which must be maintained with great accuracy. Satisfactory results when welding 3 mm thick strips were obtained under the following conditions: electric generator of 9 kw voltage and 9 amp current intensity; 6 m/min welding speed; 4,000 kg compressive force. It was established that the quality of joints when welding 3 - 6 mm thick strips was improved by increasing the compression of the edges in the welding area. Welding conditions for chamfered strips are given in Table 1 and mechanical properties of joints are represented in Table 2 and 3. Overlap welding of chamfered edges with radio frequency current may be used for the production of pipes with helical seams and for

83680

Pipe Welding by Radio-Frequency Current

S/135/60/000/010/002/015
A006/A001

large-diameter pipes with straight seams. Welding without chamfering is simpler and may be used when the structures to be welded permit such type of joint. There are 7 figures and 3 tables.

TITLE: Butt-welding parts with a solid cross-section by the induction heating method

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 4, 1962, 71, abstract 4E399 (Sb. "Prom. primeneniye tokov vysokoy chastoty v elektrotermii". M.-L., Mashgiz, 1961, 74 - 77)

TEXT: Work carried out by NIITVCh in welding parts with a solid cross-section by induction heating was concentrated on producing 35 x 65, 35 x 75 and 50 x 90 flanges from grade 3 strip steel. The described induction heating method is based on the use of the "proximity" effect. The inductor is made in the form of 2 shorted loops, connected on one side by a jumper, on the other side the inductor is connected up to the supply source. The ends of the item to be butt-welded are placed inside the inductor loops, a certain gap being left between them. The magnetic flux created by the current flowing in the inductor loops in opposite directions induces in the metal ends to be butted currents flowing in opposite directions to those in the loops, but also opposite to each

AUTHOR: Demin, A. G.; Rozman, I. M.

TITLE: New shortlived isomers of ruthenium and tellurium

SOURCE: Zhurnal eksper. i teoret. fiziki, v. 45, no. 6, 1963, 2067

TOPIC TAGS: ruthenium, tellurium, ruthenium isomer, tellurium isomer, new isomers, shortlived isomers, Alpha bombardment of tin, Alpha bombardment of molybdenum, deuteron bombardment of tin, deuteron bombardment of molybdenum, radioactivity, radioactivity, gamma yield

ABSTRACT: Thick targets of chemically pure molybdenum and tin were bombarded with 22-MeV alpha particles and 11-MeV deuterons. The target gamma rays were detected with a scintillation counter and multiplier. Alpha particle bombardment of the molybdenum and tin yielded new activities with half-lives 1.85 ± 0.06 and 104 ± 5 msec and gamma-ray energies 227 and 284 (± 5) keV, respectively. The tin gamma spectrum also showed a weak 85 ± 5-keV line. A deuteron bombardment test showed that only Ru had an activity with 1.84 msec half life. It is therefore concluded that the 1.84 and 104-msec isomers

Card 1/2

ACCESSION NR: AP4009134

are 97, 117, Ru-97, and Te-117 or Te-115. The Te isomer yield is ~1 x 10^{-7} and is close to the calculated value ~6 x 10^{-7}.

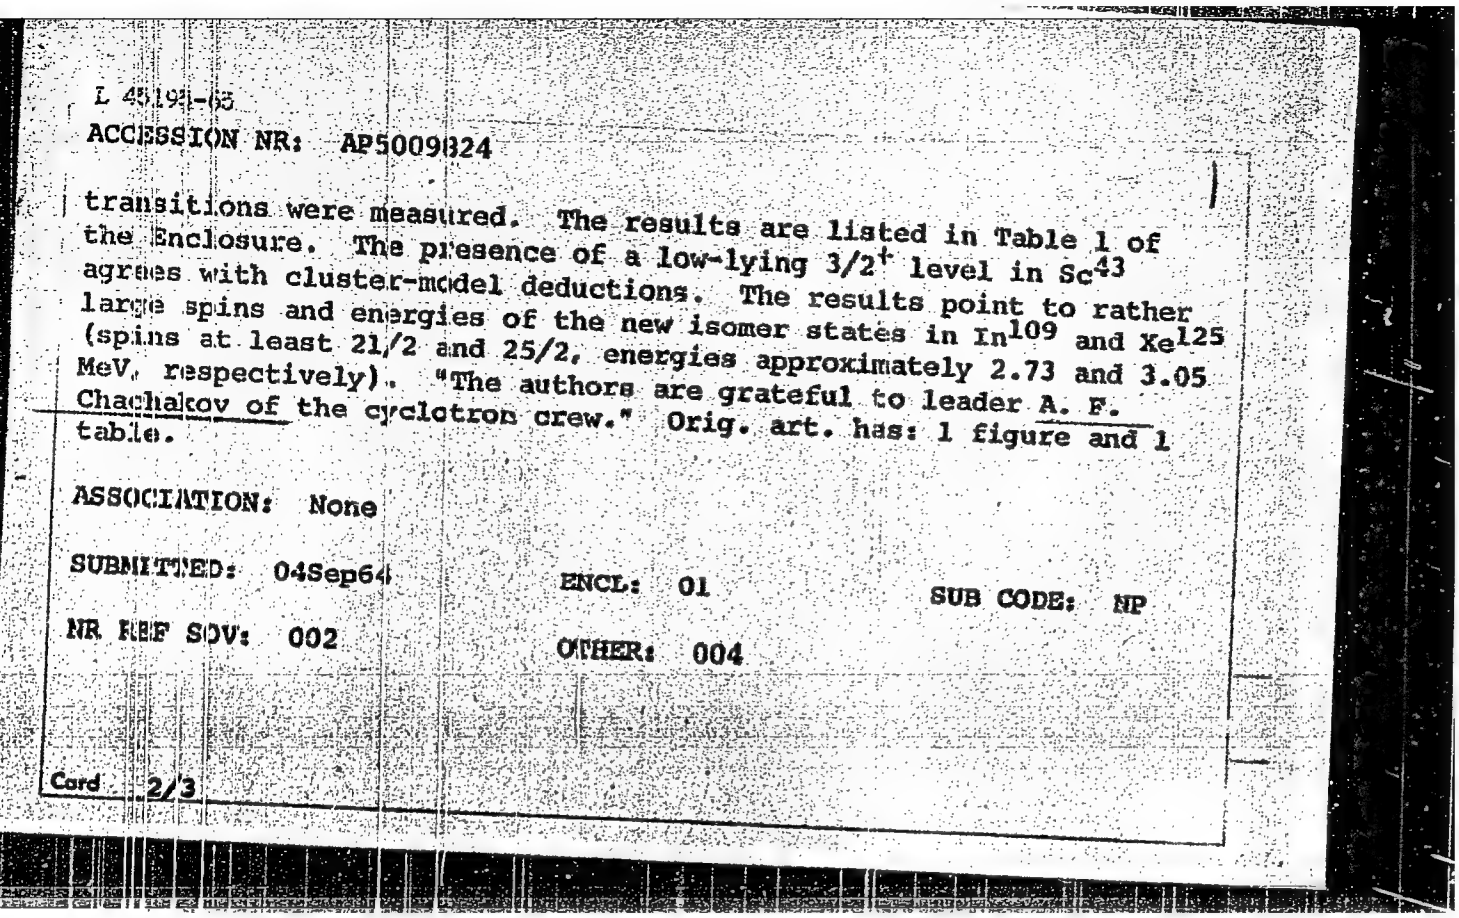
TITLE: New isomers of Sc-43, In-109, and Xe-125

SOURCE: Yadernaya fizika, v. 1, no. 2, 1965, 198-200

TOPIC TAGS: scandium, indium, xenon, short lived isomer, gamma transition, isomer spin, isomer energy

ABSTRACT: Searches for new short-life isomers (10^{-4} - 10 sec) were made by pulsed bombardment of targets with 220 MeV alpha particles and 11-MeV deuterons from an extracted cyclotron beam. The experimental procedure was described in detail earlier (ZhETF v. 45, 1344, 1963). The isomers were identified with crossing reactions by irradiating enriched Ag and Te isotopes and by comparison with the reaction yields and their variations with alpha-particle energy. The half-lifes, energies, and the relative intensities of the gamma

Card 1/3



L 45193-65
ACCESSION NR: AP5009824

transitions were measured. The results are listed in Table 1 of the Enclosure. The presence of a low-lying $3/2^+$ level in Sc^{43} agrees with cluster-model deductions. The results point to rather large spins and energies of the new isomer states in In^{109} and Xe^{125} (spins at least 21/2 and 25/2, energies approximately 2.73 and 3.05 MeV, respectively). "The authors are grateful to leader A. F. Chachakov of the cyclotron crew." Orig. art. has: 1 figure and 1 table.

TITLE: New Isotopes of Antimony (Novyye izotopy sur'my)

PERIODICAL: Atomnaya energiya, 1958, Vol 5, Nr 6, pp 660 - 660 (USSR)

ABSTRACT: An enriched tin preparation [Sn^{112}(52,3 %), Sn^{114}(57,2 %)] was bombarded with 10 MeV deuterons. Two hitherto unknown activities with 7,0 ± 0,5 min and 31 ± 1 min half life were measured. In both cases the β^+-limiting energy (measured by the absorption method) amounted to 2 MeV.
Chemical separation of both activities showed that antimony isotopes were concerned. The probable reactions are $Sn^{112}(d,n)Sb^{113}$ and $Sn^{114}(d,n)Sb^{115}$.
The decay scheme is at present being further investigated.

AUTHOR: Demin, A.M.

TITLE: Geologic Correlations of Intrusive Rocks of the Khazna-Don River Basin (Geologicheskiye sootnosheniya intruzivnykh porod basseyna reki Khazny-Don) Northern Caucasus (Severnyy Kavkaz)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1957, # 8, p 53-66 (USSR)

ABSTRACT: Intrusive rocks are widely spread in the basin of the Khazna-Don river, being represented by ancient complexes of rocks in which the principal role belongs to "granitoids of the Main Ridge". Studying the petrographic composition of these intrusive rocks and their geological relations, the author came to the following conclusions: All intrusive formations of this area have active contacts with crystalline slates, being unconformally overlaid or being in tectonic contact with the Lower-Jurassic sandy slate-like sediments. Crystalline slates are probably of the same age, and are characterized by a comparatively low degree of metamorphism. This circumstance indicates their Lower-Paleozoic age rather than the pre-Cambrian. Intrusive rocks of the area are divided into 3-age groups. The formation of each group proceeded in

Card 1/3

Geologic Correlations of Intrusive Rocks of the Khazna-Don River Basin. Northern Caucasus.

but also, in the greater degree, by metasomatic transformations, mainly by the quartz and alkaline metasomatosis. As a result, various hybrid rocks were formed, such as quartz plagiogranites of the second group. Metasomatic alterations of the rocks of the first and second groups, in particular their microclinization, are probably connected with intrusions of the granites of the third group. The polymetal mineralization is spatially connected with the granites of the second group, and the rare-metal mineralization with the granites of the third group.
The article contains 3 photos, 7 figures and 28 Slavic references.

TITLE: Geochemistry of Potassium, Rubidium and Thallium Applied to Problems of Petrology (Geokhimiya kaliya, rubidiya i talliya v prilozhenii k voprosam petrologii)

PERIODICAL: Geokhimiya, 1958, Nr 6, pp 570 - 581 (USSR)

ABSTRACT: Rocks of the Malo-Labinskiy massif in the Glavnyy Kavkazskiy khrebet zone were investigated. K and Rb were flame photometrically determined according to Ye. A. Fabrikova (Ref 7). The accuracy was 7%. Tl was determined according to a method by N. T. Voskresenskaya (Ref 4), accuracy 15 - 17%. Tables 1, 2 and 3 show the distribution of the three elements in the main intrusion phases. Table 4 presents a summary and the Rb/Tl, K/Rb and K/Tl ratio. The mineral fractions of quartz, feldspar and biotite (Tables 5 - 7) were also investigated. On tables 8 and 9 a survey is given as well as the ratio. The results of geochemical investigation agree with petrographical observations: The granitoids of the massif originate from a common magmatic focus. The content increases from older to younger rocks, the K/Rb and K/Tl ratio (tonalite - coarse-grained microcline mica

Card 1/2

biotite granite - leucocratic granite - alaskite) decreases in the same direction. The results of analyses are in favor of a metasomatic formation of the porphyritic granodiorites. Biotite contains comparatively more Rb and Tl. In feldspars containing a higher percentage of acid, Rb and Tl are more intensively concentrated than potassium.
The authors thank A. A. Saukov, N. T. Voskresenskaya and Ye. A. Fabrikova for advice in their work. There are 9 tables and 12 references, 6 of which are Soviet.
